Hello,

The following submission has been created.

Track Name: Track 1: AI, ML, and DL

Paper ID: 130

Paper Title: Discovering Mental Disorders Leveraging Contrastive Learning

Abstract:
Mental health disorders such as depression, anxiety, and stress have become increasingly prevalent worldwide. Early detection of these conditions is essential for providing timely psychological support and improving individuals' overall well-being. However, traditional diagnostic approaches primarily rely on clinical interviews and self-reported questionnaires, which may not always ensure accurate or timely identification of mental health issues. With the rapid advancement of AI-based models, automated mental health assessment systems have gained significant attention in recent years. This paper introduces a model for detecting and analysing mental health disorders using contrastive learning techniques.
The proposed system aims to analyse multimodal psychological indicators and extract meaningful representations that can distinguish among different mental health conditions. Contrastive learning learns effective feature embeddings by maximising the similarity between related samples while minimising it between unrelated samples. This approach enables the model to capture subtle patterns within the data and enhance classification performance. The proposed architecture integrates modern deep learning methods with advanced feature-learning techniques.
The system is trained to identify patterns associated with various mental health states, enabling more accurate classification of emotional and psychological conditions. The introduced model effectively captures audio and image modalities. We employed two benchmark datasets, "MODMA" and "RAVDESS," to evaluate the efficacy of the introduced model. We conducted a comparative study with some baselines and state-of-the-art models. The results of the introduced model are promising.
